基礎 Python 程式設計練習

— Session 11 —

<https://meet.google.com/wpx-yabb-tka>

進來的人請跟我說一聲

有人進來我們就開始

**Please talk to me, when you
come in.**

**When you come in, we start the
session.**

- Date/Time: 15 May 2025
- Google Meet: <https://meet.google.com/wpx-yabb-tka>
- Language: English, or Chinese, or Japanese
- Anyone can join this activity.
- This activity is organised in conjunction with the course “Doing Astrophysics using Python”. If you take the course “Doing Astrophysics using Python” and you would like to study basic Python programming, you are highly encouraged to join this activity.
- Activity web page: <https://s3b.astro.ncu.edu.tw/ipyper/>

基礎 Python 程式設計練習

<https://s3b.astro.ncu.edu.tw/ipyper/>

Some notes for you

- › Ask a question to me at any time, if you have any difficulty.
- › When you finish writing your code, tell me about it.
- › Show me your source code, if you have an error for your code and cannot find a way to fix it.
- › Tell me if you want me to provide a sample code for you.
- › Be active, then you gain more.

- 如果想要問問題，請跟我說。什麼時候都可以。
- 你的程式寫完的時候，請跟我說一聲。
- 如果你不確定你自己寫的程式寫得好不好，請給我看你寫的原始碼。我跟你說我的意見。
- 如果你想要看我的寫法，請跟我說。我寫給你看。
- 比較主動一點，你的收穫比較多。

- Visit the following web page and download the paper.
 - » https://www.aanda.org/articles/aa/full_html/2014/09/aa24039-14/aa24039-14.html
- Read the section 3.2.1 “The logarithmic spiral arm models” to learn about the mathematical expression for the locations of spiral arms.
- Check the Table 1 to find parameters $R_1, \theta_1, \Psi_1, R_2, \dots$ for 4-arm model.
- Use Matplotlib to visualise the locations of spiral arms of the Milky Way Galaxy. Save the plot as a PNG file.

Spiral arms of the Milky Way Galaxy

The screenshot shows a web browser displaying the journal *A&A* (Astronomy & Astrophysics) on a computer screen. The page title is "The observed spiral structure of the Milky Way | Astronomy & Astrophysics (A&A) | EDP Sciences". A cookie consent banner at the top asks for permission to store audience measurement cookies. The main navigation bar includes links for "edp sciences", "Astronomy & Astrophysics", "All volumes", "For authors", "Search", and "Menu". Below the navigation is a large image of a spiral galaxy. The URL in the address bar is https://www.aanda.org/articles/aa/full_html/2014/09/aa24039-14/aa24039-14.html. The left sidebar contains "Free Access" information: Issue A&A Volume 569, September 2014; Article Number A125; Number of page(s) 21; Section Galactic structure, stellar clusters and populations; DOI <https://doi.org/10.1051/0004-6361/201424039>; Published online 03 October 2014. To the right are buttons for "All volumes", "Special issues", "Review articles", "Forthcoming articles", and "Press releases". The main content area features the article title "The observed spiral structure of the Milky Way" with two asterisks, the authors "L. G. Hou and J. L. Han", and links for "Table of Contents", "Article contents", "Abstract", "Full HTML", and "PDF (5.546 MB)".

https://www.aanda.org/articles/aa/full_html/2014/09/aa24039-14/aa24039-14.html

- Superimpose the locations of spiral arms into the plot you have made last week.
- Make a PNG file.

- We will have next meeting on 22 May 2025 .
 - » Google Meet: <https://meet.google.com/wpx-yabb-tka>
- We start the activity at 20:00.

"The Python Tutorial"

The screenshot shows a web browser displaying the Python Tutorial documentation. The URL in the address bar is <https://docs.python.org/3/tutorial/>. The page title is "The Python Tutorial". The left sidebar contains navigation links: "Previous topic" (Changelog), "Next topic" (1. Whetting Your Appetite), and "This Page" (Report a Bug, Show Source). The main content area starts with a brief introduction: "Python is an easy to learn, powerful programming language. It has efficient high-level data structures and a simple but effective approach to object-oriented programming. Python's elegant syntax and dynamic typing, together with its interpreted nature, make it an ideal language for scripting and rapid application development in many areas on most platforms." It then discusses the availability of the interpreter and standard library, and introduces the tutorial's purpose: "This tutorial introduces the reader informally to the basic concepts and features of the Python language and system. It helps to have a Python interpreter handy for hands-on experience, but all examples are self-contained, so the tutorial can be read off-line as well." Finally, it provides links to further resources: "The Python Standard Library", "The Python Language Reference", "Extending and Embedding the Python Interpreter", and "Python/C API Reference Manual".

"The Python Tutorial"

The screenshot shows a web browser displaying the Python Tutorial. The page title is "7.2. Reading and Writing Files". The left sidebar contains a "Table of Contents" with sections like "7. Input and Output", "7.1. Fancier Output", "7.2. Reading and Writing Files", and "7.2.1. Methods of File Objects". Below the TOC are links for "Previous topic" (Modules) and "Next topic" (Errors and Exceptions). At the bottom of the sidebar are links for "Report a Bug" and "Show Source".

7.2. Reading and Writing Files

`open()` returns a [file object](#), and is most commonly used with two positional arguments and one keyword argument: `open(filename, mode, encoding=None)`

```
>>> f = open('workfile', 'w', encoding='utf-8')
```

The first argument is a string containing the filename. The second argument is another string containing a few characters describing the way in which the file will be used. `mode` can be `'r'` when the file will only be read, `'w'` for only writing (an existing file with the same name will be erased), and `'a'` opens the file for appending; any data written to the file is automatically added to the end. `'r+'` opens the file for both reading and writing. The `mode` argument is optional; `'r'` will be assumed if it's omitted.

Normally, files are opened in *text mode*, that means, you read and write strings from and to the file, which are encoded in a specific `encoding`. If `encoding` is not specified, the default is platform dependent (see [open\(\)](#)). Because UTF-8 is the modern de-facto standard, `encoding="utf-8"` is recommended unless you know that you need to use a different encoding. Appending a `'b'` to the mode opens the file in *binary mode*. Binary mode data is read and written as [bytes objects](#). You can not specify `encoding` when opening file in binary mode.

In text mode, the default when reading is to convert platform-specific line endings (`\n` on Unix, `\r\n` on Windows) to just `\n`. When writing in text mode, the default is to convert occurrences of `\n` back to platform-specific line endings. This behind-the-scenes modification to file data is fine for text files, but will corrupt binary data like that in JPEG or EXE files. Be very careful to use binary mode when reading and writing such files.

It is good practice to use the `with` keyword when dealing with file objects. The advantage is that the file is properly closed after its suite finishes, even if an exception is raised at some point. Using `with` is also much shorter

<https://docs.python.org/3/tutorial/>

"The Python Tutorial"

The screenshot shows a web browser displaying the Python tutorial at <https://docs.python.org/3/tutorial/controlflow.html#>. The page title is "4.2. for Statements". The content discusses the difference between Python's `for` statement and those in C or Pascal, noting that it iterates over items of any sequence. It includes a code example:

```
>>> # Measure some strings:  
>>> words = ['cat', 'window', 'defenestrate']  
>>> for w in words:  
...     print(w, len(w))  
...  
cat 3  
window 6  
defenestrate 12
```

Below this, it notes that modifying a collection while iterating over it can be tricky and provides two strategies:

```
# Create a sample collection  
users = {'Hans': 'active', 'Eléonore': 'inactive', '景太郎': 'active'}  
  
# Strategy: Iterate over a copy  
for user, status in users.copy().items():  
    if status == 'inactive':  
        del users[user]  
  
# Strategy: Create a new collection  
active_users = {}  
for user, status in users.items():  
    if status == 'active':  
        active_users[user] = status
```

<https://docs.python.org/3/tutorial/>

"The Python Tutorial"

The screenshot shows a web browser displaying the Python tutorial at <https://docs.python.org/3/tutorial/introduction.html#first-steps-towards-programming>. The page title is "3.2. First Steps Towards Programming". On the left, there's a "Table of Contents" sidebar with sections like "3. An Informal Introduction to Python" and "3.2. First Steps Towards Programming". The main content area contains a code example demonstrating a Fibonacci series:

```
>>> # Fibonacci series:  
>>> # the sum of two elements defines the next  
>>> a, b = 0, 1  
>>> while a < 10:  
...     print(a)  
...     a, b = b, a+b  
...  
0  
1  
1  
2  
3  
5  
8
```

Below the code, a note says: "This example introduces several new features." followed by two bullet points explaining Python-specific concepts like multiple assignment and while loops.

 - 4.9.3.4. Function Examples

<https://docs.python.org/3/tutorial/>

"The Python Tutorial"

The screenshot shows a browser window displaying the Python documentation for 'if Statements'. The URL is <https://docs.python.org/3/tutorial/controlflow.html#if-statements>. The page includes a table of contents on the left and code examples for an if statement.

Table of Contents

- 4. More Control Flow Tools
 - 4.1. if Statements
 - 4.2. for Statements
 - 4.3. The range() Function
 - 4.4. break and continue Statements
 - 4.5. else Clauses on Loops
 - 4.6. pass Statements
 - 4.7. match Statements
 - 4.8. Defining Functions
 - 4.9. More on Defining Functions
 - 4.9.1. Default Argument Values
 - 4.9.2. Keyword Arguments
 - 4.9.3. Special parameters
 - 4.9.3.1. Positional-or-Keyword Arguments
 - 4.9.3.2. Positional-Only Parameters
 - 4.9.3.3. Keyword-Only Arguments
 - 4.9.3.4. Function

4.1. if Statements

Perhaps the most well-known statement type is the `if` statement. For example:

```
>>> x = int(input("Please enter an integer: "))
Please enter an integer: 42
>>> if x < 0:
...     x = 0
...     print('Negative changed to zero')
... elif x == 0:
...     print('Zero')
... elif x == 1:
...     print('Single')
... else:
...     print('More')
...
More
```

There can be zero or more `elif` parts, and the `else` part is optional. The keyword 'elif' is short for 'else if', and is useful to avoid excessive indentation. An `if ... elif ... elif ...` sequence is a substitute for the `switch` or `case` statements found in other languages.

If you're comparing the same value to several constants, or checking for specific types or attributes, you may also find the `match` statement useful. For more details see [match Statements](#).

4.2. for Statements

The `for` statement in Python differs a bit from what you may be used to in C or Pascal. Rather than always iter-

 - 4.9.3.3. Keyword-Only Arguments
 - 4.9.3.4. Function Examples
 - 4.9.5. Recursion

<https://docs.python.org/3/tutorial/>

"The Python Tutorial"

The screenshot shows a web browser window displaying the Python tutorial. The URL in the address bar is <https://docs.python.org/3/tutorial/controlflow.html#defining-functions>. The page title is "4.8. Defining Functions". The left sidebar contains a "Table of Contents" for Chapter 4, which includes sections like "4.1. if Statements", "4.2. for Statements", and "4.9. More on Defining Functions". The main content area shows code examples for defining a Fibonacci series function:

```
>>> def fib(n):      # write Fibonacci series less than n
...     """Print a Fibonacci series less than n."""
...     a, b = 0, 1
...     while a < n:
...         print(a, end=' ')
...         a, b = b, a+b
...     print()
...
>>> # Now call the function we just defined:
>>> fib(2000)
0 1 1 2 3 5 8 13 21 34 55 89 144 233 377 618 987 1597
```

The text explains that the keyword `def` introduces a function *definition*. It must be followed by the function name and the parenthesized list of formal parameters. The statements that form the body of the function start at the next line, and must be indented.

The first statement of the function body can optionally be a string literal; this string literal is the function's documentation string, or *docstring*. (More about docstrings can be found in the section [Documentation Strings](#).) There are tools which use docstrings to automatically produce online or printed documentation, or to let the user interactively browse through code; it's good practice to include docstrings in code that you write, so make a habit of it.

The execution of a function introduces a new symbol table used for the local variables of the function. More precisely, all variable assignments in a function store the value in the local symbol table; whereas variable references first look in the local symbol table, then in the local symbol tables of enclosing functions, then in the global symbol table, and finally in the table of built-in names. Thus, global variables and variables of enclosing functions

<https://docs.python.org/3/tutorial/>

"The Python Tutorial"

The screenshot shows a web browser window displaying the Python tutorial at <https://docs.python.org/3/tutorial/controlflow.html#more-on-defining-functions>. The page is titled "4.9. More on Defining Functions". On the left, there is a table of contents for chapter 4, which includes sections like "4.1. if Statements", "4.2. for Statements", "4.3. The range() Function", and "4.9. More on Defining Functions". The "4.9. More on Defining Functions" section is expanded, showing sub-sections such as "4.9.1. Default Argument Values", "4.9.2. Keyword Arguments", and "4.9.3. Special parameters". The main content area discusses defining functions with variable arguments and provides a code example for a function named `ask_ok`.

4.9. More on Defining Functions

It is also possible to define functions with a variable number of arguments. There are three forms, which can be combined.

4.9.1. Default Argument Values

The most useful form is to specify a default value for one or more arguments. This creates a function that can be called with fewer arguments than it is defined to allow. For example:

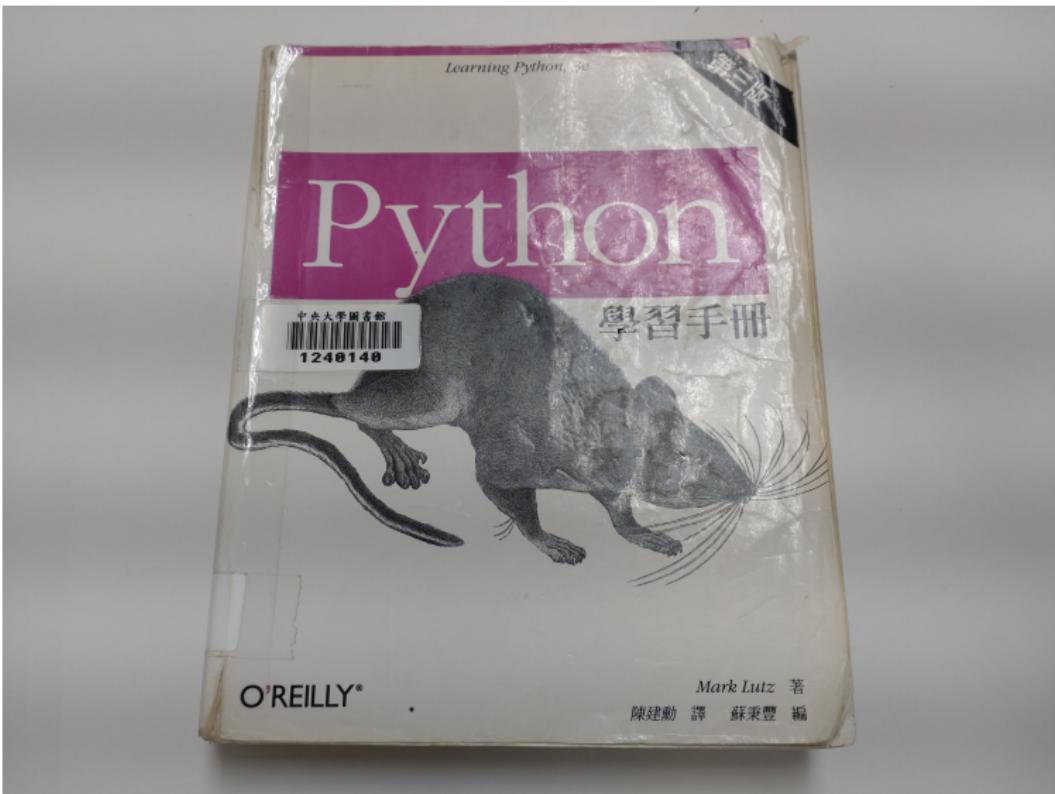

```
def ask_ok(prompt, retries=4, reminder='Please try again!'):
    while True:
        reply = input(prompt)
        if reply in {'y', 'ye', 'yes'}:
            return True
        if reply in {'n', 'no', 'nop', 'nope'}:
            return False
        retries = retries - 1
        if retries < 0:
            raise ValueError('invalid user response')
    print(reminder)
```

This function can be called in several ways:

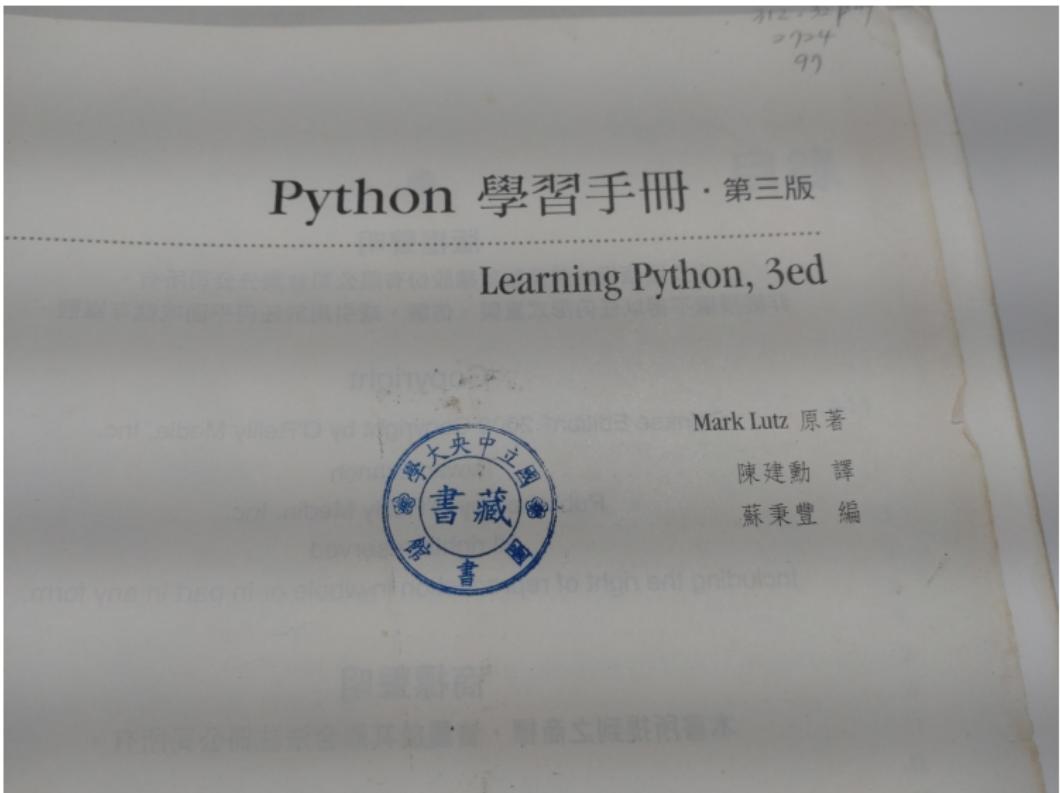

- giving only the mandatory argument: `ask_ok('Do you really want to quit?')`
- giving one of the optional arguments: `ask_ok('OK to overwrite the file?', 2)`
- or even giving all arguments: `ask_ok('OK to overwrite the file?', 2, 'Come on, only yes or no!')`
